Translating:MediaWiki

This page contains changes which are not marked for translation.

Translate this project | Recent changes | Translation statistics

MediaWiki is open source wiki software on which this site runs, and which can be translated here. Support for translating hundreds of MediaWiki extensions is also available.

Translators may add `MediaWiki` to their babel box or include {{User MediaWiki}} to add themselves to Category:MediaWiki translators.

Glossary

A brief explanation of some terms used in this document:

MediaWiki
The software that powers Wikipedia and many other websites. It allows people to edit pages in collaboration.

Wikimedia
The organization that maintains Wikipedia, Wikidata, and several other websites, as well as the MediaWiki software.

Message
A translatable string.

Message documentation
While translating, documentation about the message is shown on the sidebar next to the translation. It is also known as "qqq" in MediaWiki developers' jargon.

Translation flow

You made some changes here? This is what happens then and how long it takes to take effect.

Export threshold
Messages do not start to be exported to MediaWiki until at least 13% of the core MediaWiki messages in that language have been translated (used to be 18%): under such amount, the export scripts automatically skip the language in question and developers won't add support for the language on MediaWiki. The threshold corresponds to the number of all most used messages in MediaWiki or more; see also Translatewiki.net languages.

Wikimedia sites—Wikipedia, Wikidata, Wikisource, Wikivoyage, etc.
Interface message changes should be reflected in projects once per week along with the usual deployments. Everything else (magic words, special pages...) may take from days to months.

Wikia
Wikia usually uses customised stable revisions of the MediaWiki software. Consequently, the localisation of the MediaWiki core product, and *standard* MediaWiki extension from the main repository have a stable localisation state.

Everything else
New translations are shipped with each new MediaWiki release (1.**x**) and usually with maintenance releases too (1.x.**y**). There are only a few releases per year, and many sites do not update often. Since version 1.16 onwards it is possible to install the LocalisationUpdate extension, which speeds up the process a lot.

Why translate on translatewiki.net

MediaWiki is one of the few software packages that allow its users to translate it using itself. Thanks to translatewiki.net, however, localising it is even easier and more efficient. In addition to the general advantages of this wiki, compared to local translation:

- **Your translations are used on every MediaWiki wiki**, this includes every Wikimedia wiki, see #Translation flow.
- You can localise **namespaces** (Help, User, Talk, ...), **special page names** (Recentchanges, Allpages, ...), and **magic words**.
  The message groups above cannot be localised in a normal wiki, because they are buried deep down in the software. Here you *can* localise these message groups, and later on your changes can be used in every installation of MediaWiki again. See #Translation notes below.
- You can **translate new messages faster** than on a local wiki.
  We always have the latest version of the software. This means new messages show up much faster than on any other wiki and you have more time to translate them before they arrive to your wiki. This can also mean translatewiki.net uses an unstable version, but problems are usually solved quickly.
- The only drawback is that your translations will not show up on your local wiki immediately, but after a few days to weeks; or, if you are using a release version, after the next update. However, for the previous point, there's no reason to be in a hurry: just check new messages regularly and translate them in time.
  See FAQ#How is the work done on translatewiki.net connected to other wikis?.

Extensions

All MediaWiki extensions are supported as long as they are in Wikimedia's Git repository or in GitHub and their developers are supportive enough of translators.

If you don't want your extension to be added to translation, because you're going to soon change many messages completely or to delete the extension altogether, please state it clearly somewhere so that we don't add it when it's still too soon. In both cases, cc Raymond to a changeset on gerrit if you feel your extension's case might have been neglected.

Translation notes

- For an English glossary of MediaWiki specific terminology see Meta-wiki.
- MediaWiki translation supports plural rules, grammar functions and gender. See also the general Localisation guidelines.
- Contacts:
  - For MediaWiki core and main extensions: none defined, see mw:Developers/Maintainers and mw:Gerrit/Navigation#System messages.
  - For Semantic MediaWiki extensions: Kghbln.

Recommended process for translating MediaWiki

Translators of other projects can ignore this list.

- First translate the *most often used messages*.
- Complete the *core messages*.
- Check if you should translate any *optional messages in core*.
- Do a consistency check (terminology, formal/informal) on your localisation.
- ~~Translate special page names, magic words and namespaces on <tvar|adv-tran>[[Special:AdvancedTranslate]]</>~~ *(temporarily disabled; see the section #AdvancedTranslate in this document and phab:T109235)*
- Translate the *extension messages used in Wikimedia wikis*. There are more than 10,000 messages there, so for your convenience they are further subdivided into groups: *main*, *advanced*, *media*, *fundraising*, *technical*, etc.
- Translate the *remaining extension messages*.
- Do a consistency check (terminology, formal/informal) on your localisation between core messages and extension messages
- Start maintaining your language's localisation on a regular basis. At least once per month is recommended.

Read on if you want to know more. Reading on is not required, although advised for a proper understanding of more advanced localisation features. You could spend a few days translating, though, and come back when you think you need more information.

Wiki syntax

Many messages use symbols such as ==, ===, [[]], {{}}, *, #, and so on. This is wiki syntax, also known as "wikitext" or "wiki markup". This is not a requirement, but it is recommended to be familiar with some wiki syntax by editing a few pages on another wiki site, such as Wikipedia, before translating MediaWiki messages at translatewiki.

Here are the most common and basic elements of wiki syntax that you should know:

[[target]]
Square brackets create a link to the word in the brackets.

[[target|text]]
When a pipe (|) is used in a link, the link will point to page whose name appears before the pipe (target), and the readers will see the text that appears after the pipe (text). Usually, the "text" should be translated to your language, but the target must remain in English, especially if the target is a special page such as [[Special:RecentChanges]]. If in doubt, check the documentation.

==, ===, ====
Repeated equal marks in the beginning and the end of the line are used to create page section headings. Simply copy them to the translation, and translate the text of the heading itself to your language. Make sure that the same number of equal signs appears in the beginning and the end of the line, and that it's the same as in the source message.

{{template}}, {{magicword}}, {{#magicword:parameter1|parameter2}}
In wiki sites curly braces are most often used for inserting templates, pieces of text that are stored once and are included repeatedly on many pages. They are also occasionally used for "magic words". In messages on translatewiki templates are not used frequently, however many messages include magic words. The most frequent magic words in messages are {{plural}} and {{gender}}. For more information, see the section on magic words on this page. If a magic word begins with #, it must appear in the translation. Usually, the names of templates and magic words must remain in English, but parameters can often be translated. When in doubt, check the message documentation or ask at Support.

*
When the asterisk (*) appears in the beginning of a line, it creates an item in a bullets list.

#
When the number sign (#), also known as hash mark, octothorp, hex, pound, etc., appears in the beginning of a line, it creates an item in a numbered list.

Magic words and language features

Most of what you will be translating is English text. However, some parts will be more technical: these are variables, also known as placeholders, and "magic words". Here are the main ones that you need to know.

$1, $2, $3, etc.: variables

Many messages must show things that are not known during the time of the translation. The value is known only when the message is shown to the user. Common examples of things that are shown instead of $1, $2, $3, etc. are usernames, page names, file names, and various numbers. The documentation explains what will these variables be replaced with. Examples:

- The message is "You received a message from $1" and the documentation says: "$1 is a username". When the the message is shown to a user who received a message from the user Amire80, the message will say "You received a message from Amire80".
- The message is "There are $1 pages in the category $2" and the documentation says: "$1 is the number of pages and $2 is a category name", then when you look at the category "19th-century Russian monarchs", the message will say "There are 7 pages in the category 19th-century Russian monarchs".

Put these variables in the place where the corresponding words or numbers appear in your language. It doesn't have to be the same as in English.

Note that you must always use the Western Arabic numerals: 1 2 3 4 5 6 7 8 9 0. If you language uses different numerals, such as ٣ ٢ ١, १ २ ३, ᠑ ᠒ ᠓, etc. remember to switch your keyboard and use the Western Arabic numerals 1 2 3, etc., in variables with the dollar sign ($).

PLURAL

If you see something like $1 {{PLURAL:$1|page|pages}} in a translatable message, this means that the word will be shown according to the value of the variable $1. Note that you must not change the "PLURAL:$1" part, but you must translate the "page|pages" part.

Different languages have different grammatical rules for plural forms. English has one form (singular) for the number 1, and the plural form is used for zero and for all the other numbers: *0 pages*, *1 page*, *2 pages*, *10 pages*, etc. Polish uses singular for number 1, and different plural forms for numbers 2, 3, 4, and numbers from 5 and up. The translation to Polish will be "$1 {{PLURAL:$1|strona|strony|stron}}"; note that there are three forms, and not two, like in English. The output, depending on the number, will be:

- when $1 is 1: *1 strona*
- when $1 is 2: *2 strony*
- when $1 is 4: *4 strony*
- when $1 is 5: *5 stron*

The rules are defined in a standard called CLDR, which has information about many languages. If information about plural forms in your language is not defined, or if it is defined incorrectly, see the page CLDR for tips about how it can be fixed.

If your language has no plural forms at all, then simply write something like $1 {{PLURAL:$1|page}}.

For more technical information on PLURAL, see the page Plural.

GENDER

Many messages depend on the grammatical gender of the users who are mentioned in them, masculine or feminine. Each logged in user can select their gender in their user preferences.

Here is an example of how gender is used in messages. The message is "$1 {{GENDER:$1|mentioned}} you on {{GENDER:$1|his|her|their}} talk page", and the documentation says "$1 - user's name".

- If you use MediaWiki in English, the verb "mentioned" will be the same everywhere, because English verbs don't change with gender, but the pronoun will be chosen according to gender:
  - When user Jack, who set his gender to "he" (masculine) in the preferences, mentioned you, you will see the following: "Jack mentioned you on his talk page".
  - When user Jane, who set her gender to "she" (feminine) in the preferences, mentioned you, you will see the following: "Jane mentioned you on her talk page".
  - When user Lee, who didn't set their gender in the preferences, mentioned you, you will see the following: "Lee mentioned you on their talk page".
- If you use MediaWiki in Polish, the verb changes, but the pronoun in this sentence is the same. The translation to Polish is $1 {{GENDER:$1|wspomniał|wspomniała|wspomniał(a)}} o tobie na {{GENDER:$1|swojej}} stronie"
  - Jack wspomniał o tobie na swojej stronie.
  - Jane wspomniała o tobie na swojej stronie.
  - Lee wspomnieli o tobie na swojej stronie.

If {{GENDER}} is used in the English message, but different gender forms are not needed in the translation to your language, just write GENDER with one form.

Do not translate the word "GENDER" into your language. It's a technical magic word, and it must remain in English.

For more technical information on GENDER, see the page Gender.

Other magic words

If you need to refer to the name of the site, you can use the magic word {{SITENAME}}. (It usually appears in the source message.)

If your language uses inflection or special punctuation, you should talk to the developers about implementing some support for it. Once this is done you can use forms like {{GRAMMAR:genitive|{{SITENAME}}}} to refer to the sitename in genitive.

You may also see HTML tags such as <strong>, <var>, <kbd>, <span>, and others in messages. You should usually copy the tags in the corresponding places in the translation. Sometimes you should translate the content inside these tags, and sometimes you should leave it as in the original message. Consult the documentation for each message.

Never translate magic words and HTML tags. They must always remain in English, as in the source message.

Links to special pages

Links to special pages in messages must always follow the syntax: `[[Special:EnglishName|Translated name]]`

The "Special:EnglishName" part must stay as is. Just copy it into the translation. The "Translated name" part, after the vertical bar (|), is shown to the reader, so translate it into your language in a way that will look natural and convenient as a link target and a part of a sentence. If there is no vertical bar (|) followed by link text in the original message, add them in the translation.

Subpage names that appear after a slash (|) after the special page name must also be left untranslated. Take the following message as an example: `[[Special:Log/delete|Deletion log]]`. Don't translate "`Special:Log/delete`", but do translate "Deletion log". For example, when translation into Russian, write like the following: `[[Special:Log/delete|Журнал удалений]]`.

Translating namespace names

Every page on a MediaWiki site belongs to a namespace.

The main namespace, also known as the content space or the article space, includes the main content pages of the site. For example, on Wikipedia the encyclopedic articles are in the main namespace, on Wikivoyage the tour guide pages are in the main namespace, and so on. Other namespaces are for pages of discussions, help, documentation, user pages, and so on. See details below.

The name of the namespace appears in the beginning of the page, except for the pages in the main namespace. For example, all the pages in the Help namespace have names such as "Help:Editing", "Help:Uploading", and so on.

Pages in most (but not all) namespace can have a corresponding talk page, and these talk pages are in namespaces of their own. The talk namespace of the main namespace is called simply "Talk", the talk namespace of the Help namespace is called "Help talk", and so on.

Namespace names can be translated. If they aren't translated, they will appear in the fallback language. English namespace names can always be used in links to pages instead of the translated names.

Namespace name explanations

In the tables below, only the translation of the names in the "Namespace name" column is needed. The explanation is provided only for the convenience of the translators.

The namespaces that are used on all MediaWiki sites:

Namespace name	Description
Media	A general name for various media files stored in a common media repository. For example: image file, audio file, video file, etc.
Special	This is an adjective. It's a namespace for special pages, which automatically show information about the wiki, such as Recent Changes, History, Statistics, Blocking, etc.
Talk	The talk page for the main namespaces. Talk pages is where discussion about other pages takes place.
User	This is a user of the wiki. If there are masculine and feminine forms for the word "user" in your wiki, it's possible to add both.
User talk	This is the talk page of a user. It's used for discussing things directly with a person, where as article talk pages are for talking about an article.
Project talk	The word "Project" is replaced with the name of the project, for example: "Wikipedia talk", "Wikisource talk", etc. This is for talk pages where the wiki site's internal administration pages are discussed.
File	A file, usually photos, videos, music, and PDFs. These pages show the file and some information about it.
File talk	A talk page for discussions about the file.
MediaWiki	Each pages in this namespace stores a translatable message. If a page exists, its content overrides the translation in the source code and in translatewiki. The spelling of the name "MediaWiki" can be adapted to your language, but it's nevertheless a name, and must remain recognizable.
MediaWiki talk	A talk page for discussions about the message in the MediaWiki namespace.
Template	A piece of text or code that can be embedded in other pages. Common examples of templates are infoboxes, citations, tags at the top of the article, etc.
Template talk	A talk page for discussions about a template.
Help	This is a namespace for help pages, which explain the users how to use the website.
Help talk	A talk page about help pages.
Category	These are pages that describe a category that includes other pages.
Category talk	A talk page about category pages.

These namespaces are used in common extensions, and should be translated as well:

Namespace name	Description
Module	Modules are pieces of code that can be embedded into pages. They are similar to templates, but they are written in a programming language and not in wiki syntax.
Module talk	A talk page about a module.
Gadget	Gadgets are pieces of JavaScript code that can be written on a wiki site by the site's editors to enhance the site's functionality. They are stored as wiki pages.
Gadget talk	A talk page about a gadget.
Gadget definition	The gadget definition space is used for configuration metadata about a gadget.
Gadget definition talk	A talk page about a gadget definition.
Topic	A single discussion on a discussion board built using the Flow extension (also known as Structured Discussion). The word "topic" can be translated as in "a *topic* of discussion".
Page	In Wikisource sites, the page namespace shows a single page from a file that represents a book, such as PDF or DjVu, and allows people to transcribe it to a digital text.
Page talk	A talk page about a page.
Index	In Wikisource sites, the Index namespace describes a file that represents a book, such as PDF or DjVu, and maps between page numbers and different parts of the book.
Index talk	A talk page about an index.

AdvancedTranslate

Before 2015, it was possible to translate names of namespaces and special pages in translatewiki on the page Special:AdvancedTranslate. Unfortunately, it had to be disabled for technical reasons. See gerrit:211677.

While the page is disabled, you can get these translated by using one of the following options:

- file a request on Support,
- directly request it on Phabricator (file a bug for the MediaWiki extension in question), or
- [with some command-line skills] do it yourself with gerrit.

In some rare cases where an extension doesn't support translation of namespaces, translation needs to be done with a local configuration setting for each wiki instead. See #Namespace name aliases. The developers will tell you if this is the case, answering your request.

Namespace name aliases

As of 2015, AdvancedTranslate is disabled.

Since namespace name aliases cannot be localised via translatewiki.net's Special:AdvancedTranslate because of their highly technical nature, you must make a request at support. Please list pairs of alias names, and their corresponding English namespace names. As a rule of thumb, whenever you alter namespace names via Special:AdvancedTranslate, and there is a wiki using the affected language as its default language, do report it!

Sitename/project namespace on Wikimedia wikis

If the sitename at your project is not localized, you should contact the other contributors at your project and find consensus about translation, then open a request at Phabricator; see m:Requesting wiki configuration changes.

Other technical issues

On MediaWiki, much more can be localised: see mw:Localisation#What can be localised.

Exports

Languages with translation completion less than 0 % are not committed to version control. If the project consists of multiple message groups, the limit is applied to each group separately.

Wikimedia Gerrit
Translation updates are exported to version control every day

GitHub
Translation updates are exported to version control every Monday and Thursday. (Export threshold is 25 %)

Translation statistics
